

# Thermal Burn

## History

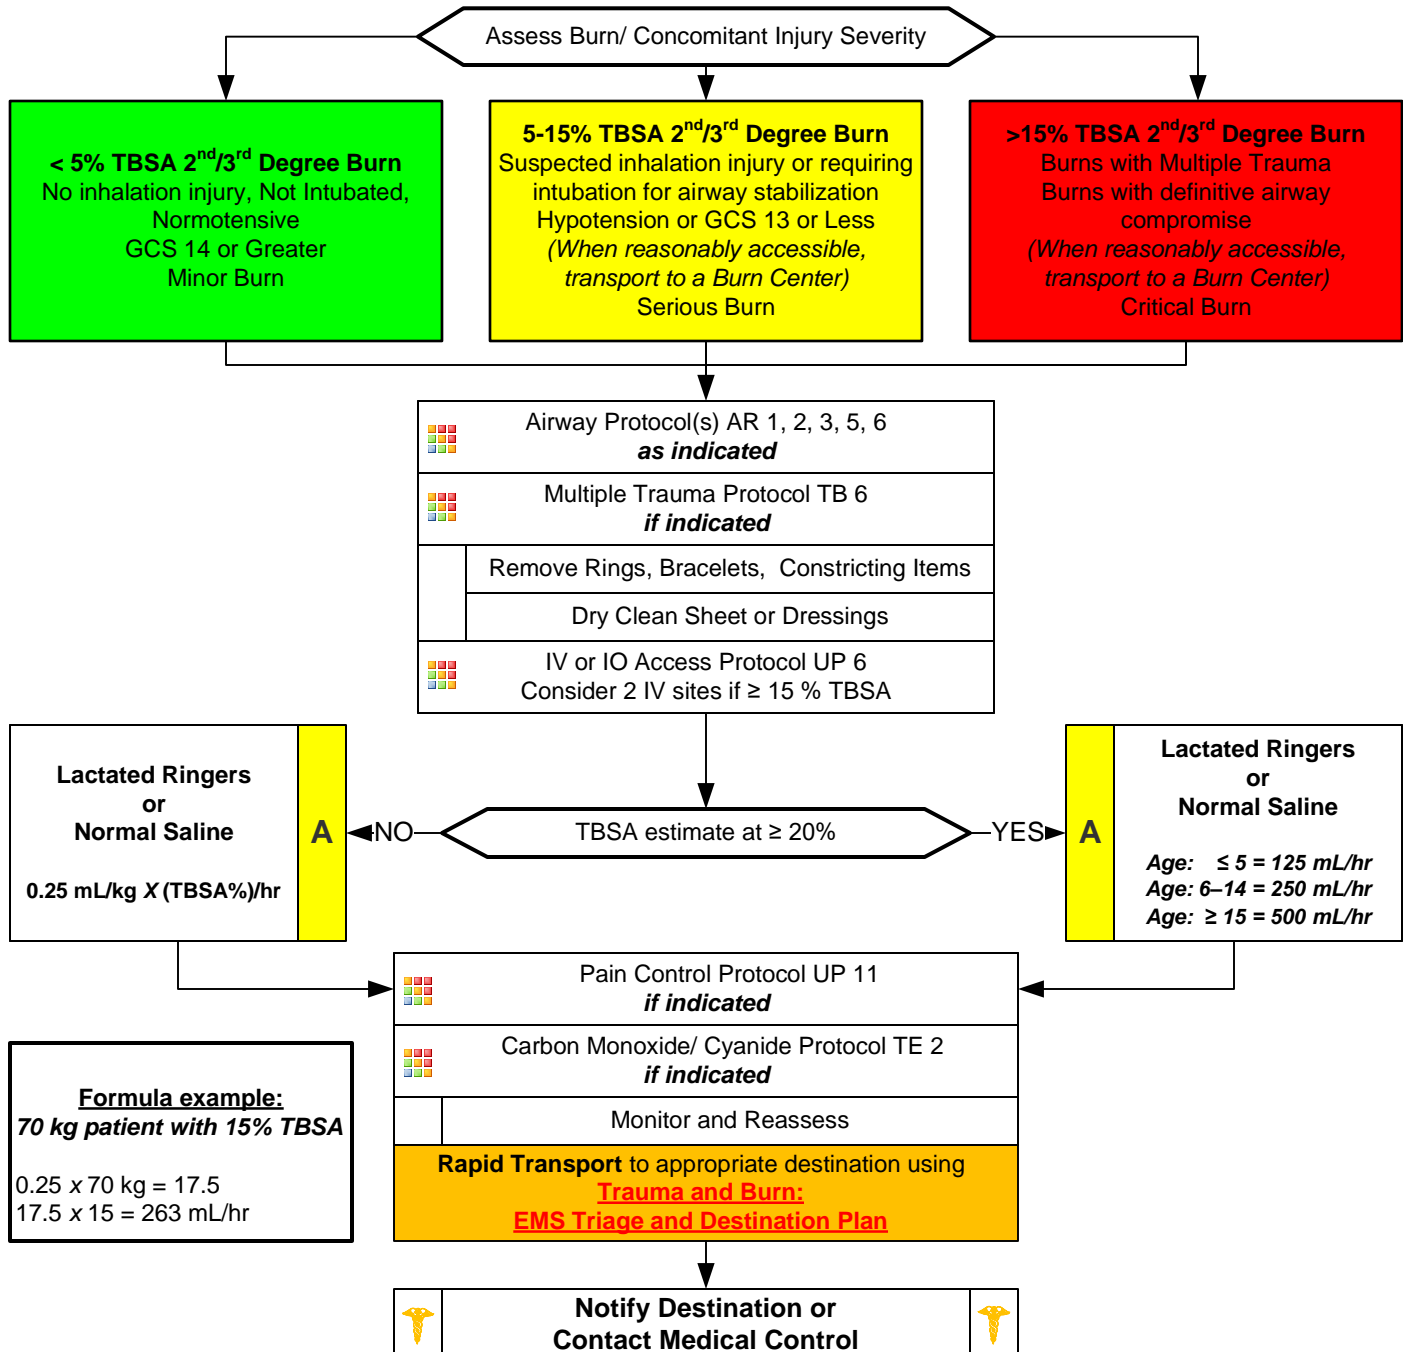

- Type of exposure (heat, gas, chemical)
- Inhalation injury
- Time of Injury
- Past medical history/ Medications
- Other trauma
- Loss of Consciousness
- Tetanus/Immunization status

## Signs and Symptoms

- Burns, pain, swelling
- Dizziness
- Loss of consciousness
- Hypotension/shock
- Airway compromise/ distress could be indicated by hoarseness/ wheezing

## Differential

- Thermal / Chemical / Electrical Burn Injury
  - Superficial (1<sup>st</sup> Degree) red – painful (Don't include in TBSA)
  - Partial Thickness (2<sup>nd</sup> Degree) blistering
  - Full Thickness (3<sup>rd</sup> Degree) painless/charred or leathery skin
- Radiation injury
- Blast injury

1. Lactated Ringers preferred over Normal Saline. Use if available, if not change over once available.

Relative percentage of body surface area (% BSA) affected by growth

Body Part	Age				
	0 yr	1 yr	5 yr	10 yr	15 yr
a = 1/2 of head	9 1/2	8 1/2	6 1/2	5 1/2	4 1/2
b = 1/2 of 1 thigh	2 3/4	3 1/4	4	4 1/4	4 1/2
c = 1/2 of 1 lower leg	2 1/2	2 1/2	2 3/4	3	3 1/4

## Rule of Nines

- Rarely find a complete isolated body part that is injured as described in the Rule of Nines.
- More likely, it will be portions of one area, portions of another, and an approximation will be needed.
- For the purpose of determining the extent of serious injury, differentiate the area with minimal or 1<sup>st</sup> degree burn (superficial) from those of partial (2<sup>nd</sup>) or full (3<sup>rd</sup>) thickness burns.
- For the purpose of determining Total Body Surface Area (TBSA) of burn, include only Partial (2<sup>nd</sup>) and Full Thickness (3<sup>rd</sup>) burns.** Report the observation of other superficial (1<sup>st</sup> degree) burns but do not include those burns in your TBSA estimate.
- Some texts will refer to 4<sup>th</sup>, 5<sup>th</sup>, and 6<sup>th</sup> degree burns. There is significant debate regarding the actual value of identifying a burn injury beyond that of the superficial, partial and full thickness burn at least at the level of emergent and primary care. For our work, all are included in Full Thickness burns.

Estimate spotty areas of burn by using the size of the patient's palm as 1 %

## Intubation in burn patients (consider the following in decision-making):

- Full-thickness (3d degree) facial burns.
- Stridor unresponsive to DuoNeb or Epinephrine nebulizer therapy.
- AMS with hypoxia and/or hypercarbia not responding to other airway management techniques.

## IV / IO Infusion Rates:

Lactated Ringer is preferred IV solution. Normal Saline may be used if LR unavailable.

## Rule of Nine:

First-degree burns do not count in the calculation of TBSA burns.

## Pearls

- Recommended Exam: Mental Status, HEENT, Neck, Heart, Lungs, Abdomen, Extremities, Back, and Neuro**
- Green, Yellow, and Red In burn severity do not apply to the Start/ JumpStart Triage System.**
- Airway considerations:**
  - For systems performing RSI, Rocuronium is preferred agent (succinylcholine can be used in the first 24-hours)
  - Singed nasal hairs, facial burns, and/ or carbonaceous sputum are NOT absolute indications for intubation in a burn patient.
  - Utilizing non-rebreather face mask as well as NIPPV procedure are acceptable as tolerated.
- Critical or Serious Burns:**
  - > 5-15% total body surface area (TBSA) 2<sup>nd</sup> or 3<sup>rd</sup> degree burns
  - 3<sup>rd</sup> (full thickness) degree burns > 5% TBSA for any age group
  - Circumferential burns of extremities
  - Electrical or lightning injuries
  - Suspicion of abuse or neglect
  - Inhalation injury
  - Chemical burns
  - Burns of face, hands, perineum, or feet
  - Require direct transport to a Burn Center. Local facility should be utilized only if distance to Burn Center is excessive or critical interventions such as airway management are not available in the field.
- Burn patients are trauma patients, evaluate for multisystem trauma.
- Assure whatever has caused the burn is no longer contacting the injury. (Stop the burning process!)
- Circumferential burns to extremities are dangerous due to potential vascular compromise secondary to soft tissue swelling.
- Burn patients are prone to hypothermia - never apply ice or cool the burn, must maintain normal body temperature.
- Evaluate the possibility of geriatric abuse with burn injuries in the elderly.
- Do not administer IM pain injections to a burn patient. IM dosing is variable in burn patients and may result in over or under dose.
