

Adult Tachycardia NARROW (≤ 0.11 sec)

History

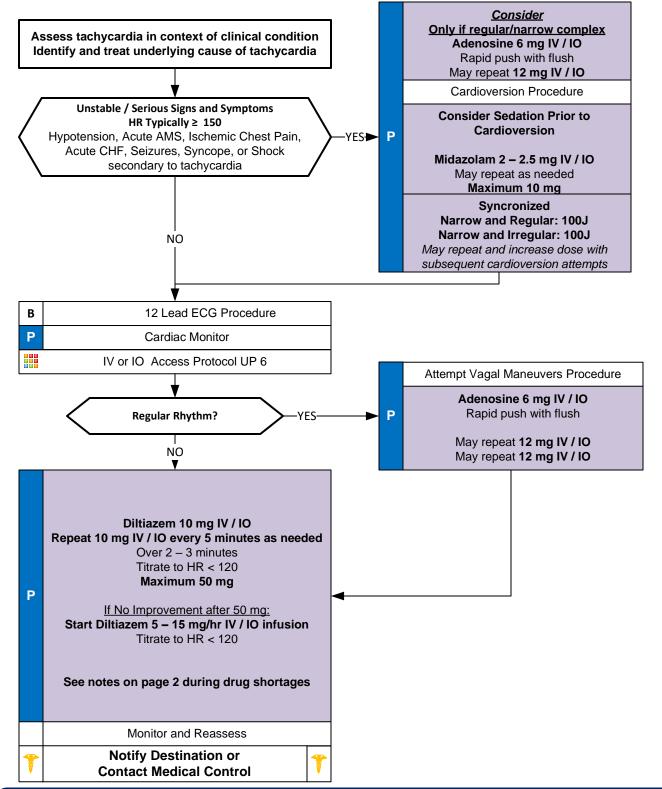

- Age
- Past medical history (MI, Angina, Diabetes, post menopausal)
- · Recent physical exertion
- Palpitations, irregular heart beat
- Time (onset /duration / repetition)

Signs and Symptoms

- Chest pain, heart failure, dyspnea
- AMS
- Shock, poor perfusion, hypotension
- Pale, diaphoresis
- · Shortness of breath
- Nausea, vomiting, dizziness

Differential

- Trauma vs. Medical
- · Sinus Tachycardia vs. dysrhythmia
- Fever, sepsis, infection
- Pericarditis, pulmonary embolism
- Aortic dissection or aneurysm
- Overdose: Stimulants

Adult Tachycardia NARROW (≤ 0.11 sec)

ECG and rhythm information should be interpreted in context of the entire patient assessment:

For example, if you have a patient which is ill from a likely infection with fever and is tachycardic to 140 – 160 there overall symptoms are unlikely related to tachycardia and more likely related to overwhelming sepsis and potentially hypoxia.

- Tachycardia is defined as heart rate > 100 but rarely causes symptoms unless > 120 in the adult.
- The most important decision point in care is whether the patient is stable or unstable.

Rate controlled:

Heart rate is considered controlled when rate is ≤ 120 beats per minute.

DRUG SHORTAGE STRATEGIES:

If DILTIZEM IS NOT AVIALBLE:

- Amiodarone 150 mg in 100 mL of D5W IV / IO and infuse over 10 minutes then start infusion of Amiodarone 450 mg in 250 mL of D5W at 1 mg/min (33 mL/hr) IV / IO.
- Or Metoprolol 2.5 mg IV / IO Slow IV Push and repeat every 5 minutes as needed to a Maximum 15 mg.
- Preference Amiodarone > referred Metoprolol
- DO NOT give Metoprolol to a patient with a CHF worsening.

Pearls

- Recommended Exam: Mental Status, Skin, Neck, Lung, Heart, Abdomen, Back, Extremities, Neuro
- Most important goal is to differentiate the type of tachycardia and if STABLE or UNSTABLE and SYMPTOMATIC.
- 12-Lead ECG:

12 Lead ECG not necessary to diagnose and treat

Obtain when patient is stable and/or following rhythm conversion.

Unstable condition

Condition which acutely impairs vital organ function and cardiac arrest may be imminent.

If at any point patient becomes unstable move to unstable arm in algorithm.

- · Search for underlying cause of tachycardia such as fever, sepsis, dyspnea, etc.
- Typical sinus tachycardia is in the range of 100 to (200 patient's age) beats per minute.
- Symptomatic condition

Arrhythmia is causing symptoms such as palpitations, lightheadedness, or dyspnea, but cardiac arrest is not

Symptomatic tachycardia usually occurs at rates ≥ 150 beats per minute.

Patients symptomatic with heart rates < 150 likely have impaired cardiac function such as CHF.

• Serious Signs / Symptoms:

Hypotension. Acutely altered mental status. Signs of shock / poor perfusion. Chest pain with evidence of ischemia (STEMI, T wave inversions or depressions.) Acute CHF.

• If patient has history or 12 Lead ECG reveals Wolfe Parkinson White (WPW):

DO NOT administer a Calcium Channel Blocker (e.g. Diltiazem) or Beta Blockers.

Use caution with Adenosine and give only with defibrillator available.

Regular Narrow-Complex Tachycardia:

Vagal maneuvers and adenosine are preferred. Vagal maneuvers may convert 19% to 54 % of SVT.

Using passive leg raise with Valsalva is more effective.

Adenosine should be pushed rapidly via proximal IV site followed by 20 mL Normal Saline rapid flush.

Adenosine should not be used in the post-cardiac transplant patient without Contact of Medical Control.

Agencies using both calcium channel blockers and beta blockers should choose one primarily. Giving the agents sequentially requires **Contact of Medical Control**. This may lead to profound bradycardia / hypotension.

• Irregular Narrow-Complex Tachycardia:

Rate control is more important in pre-hospital setting rather than focus on rhythm conversion.

• Synchronized Cardioversion:

Recommended to treat UNSTABLE Atrial Fibrillation, Atrial Flutter and SVT.

- Monitor for hypotension after administration of Calcium Channel Blockers or Beta Blockers.
- Document all rhythm changes with monitor strips and obtain monitor strips with each therapeutic intervention.
