

## Pediatric Tachycardia

### Narrow Complex (≤ 0.09 sec)

#### History

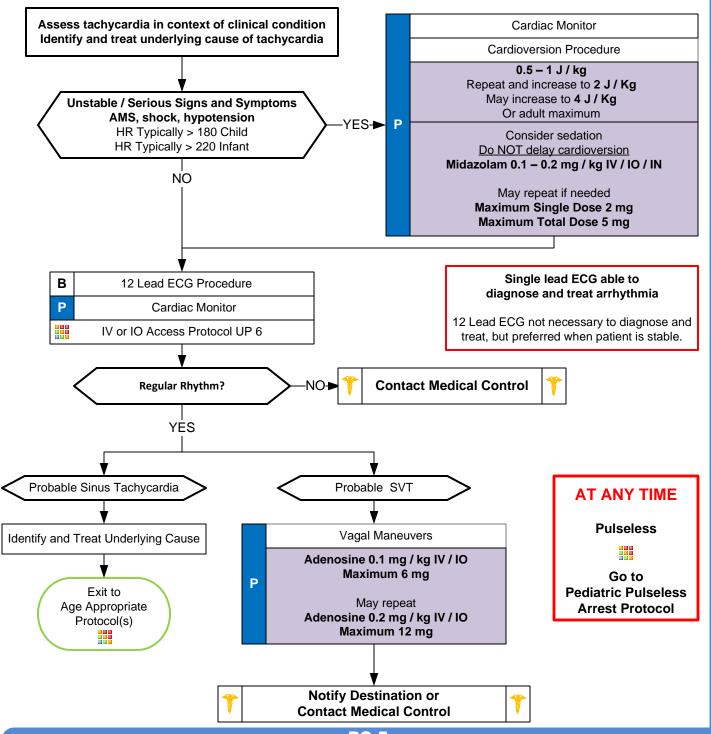

- Past medical history
- Medications or Toxic Ingestion (Aminophylline, Diet pills, Thyroid supplements, Decongestants, Digoxin)
- Drugs (nicotine, cocaine)
- Congenital Heart Disease
- Respiratory Distress
- Syncope or Near Syncope

#### **Signs and Symptoms**

- Heart Rate: Child > 180/bpm
  Infant > 220/bpm
- Pale or Cyanosis
- Diaphoresis
- Tachypnea
- Vomiting
- Hypotension
- Altered Level of Consciousness
- Pulmonary Congestion
- Syncope

#### Differential

- Heart disease (Congenital)
- Hypo / Hyperthermia
- Hypovolemia or Anemia
- Electrolyte imbalance
- Anxiety / Pain / Emotional stress
- Fever / Infection / Sepsis
- Hypoxia, Hypoglycemia
- Medication / Toxin / Drugs (see HX)
- Pulmonary embolus
- Trauma, Tension Pneumothorax

# Pediatric Tachycardia

Pediatric Cardiac Protocol Section

#### The most important decision point in care is whether the patient is stable or unstable:

- Unstable refers to patient condition in which a vital organ function is acutely impaired or cardiac arrest is ongoing or imminent.
- Symptomatic implies the arrhythmia is causing the presenting symptoms but the patient may be stable and not in imminent danger.
- This situation allows you more time to decide on the most appropriate intervention which often is supportive care only.

#### Next you must determine if a pulse is present:

- This protocol assumes a pulse is present.
- The ability to feel a pulse is generally poor so recognition of poor perfusion or arrest situation takes priority.
- You may identify signs which indicate no perfusion such as

unresponsive, apnea or agonal / irregular breathing and cool / mottled skin.

#### Midazolam:

Midazolam can be given in Single Doses to a Maximum of 2 mg.

A **Total Dose of Midazolam 5 mg** may be given before contact of Medical Control.

Intranasal Midazolam Dose:

Mix 5 mg of Midazolam in 1 mL NS

**0.2 mg/kg IN** (≥ 26 mg givne **5 mg**)

Split dose into each nostril

See chart to right:

Contact Medical Control for repeat dose.

	Midazolam IN			Midazolam IN		
	5 mg in 1 mL NS			5 mg in 1 mL NS		
	Wgt	Dose	Volume	Wgt	Dose	Volume
	kg	mg	mL	kg	mg	mL
۱.	2	0.4	0.08	14	2.8	0.56
	4	0.8	0.16	16	3.2	0.64
	6	1.2	0.24	18	3.6	0.72
	8	1.6	0.32	20	4	0.8
	10	2	0.4	22	4.4	0.88
	12	2.4	0.48	24	4.8	0.96

#### Pearls

- Recommended Exam: Mental Status, Skin, Neck, Lung, Heart, Abdomen, Back, Extremities, Neuro
- Monomorphic QRS:
  - All QRS complexes in a single lead are similar in shape.
- Polymorphic QRS:
  - QRS complexes in a single lead will change from complex to complex.
- Use length-based or weight-based pediatric resuscitation system for medication, equipment, cardioversion, and defibrillation guidance. Pediatric paddles should be used in children < 10 kg.</li>
- Rhythm should be interpreted in the context of symptoms and pharmacological or electrical treatment given only when symptomatic, otherwise monitor and reassess.
- 12-Lead ECG:
  - 12-Lead ECG not necessary to diagnose and treat.
  - Obtain when patient is stable and/or following rhythm conversion.
  - When administering adenosine, obtaining a continuous 12-Lead can be helpful to physicians.
- Unstable condition:
  - Condition which acutely impairs vital organ function and cardiac arrest may be imminent.
  - If at any point patient becomes unstable move to unstable arm in algorithm
  - If IV or IO access is in place, may administer adenosine and repeat, prior to synchronized cardioversion.
- Document all rhythm changes with monitor strips and obtain monitor strips with each therapeutic intervention.
- Serious Signs and Symptoms:
  - Respiratory distress / failure.
  - Signs of shock / poor perfusion with or without hypotension.
  - **AMS**
  - Sudden collapse with rapid, weak pulse
- Narrow Complex Tachycardia (≤ 0.09 seconds):
  - Sinus tachycardia: P waves present. Variable R-R waves. Infants usually < 220 beats / minute. Children usually < 180 beats / minute.
  - SVT: > 90 % of children with SVT will have a narrow QRS (≤0.09 seconds.) P waves absent or abnormal. R-R waves not variable. Usually abrupt onset. Infants usually > 220 beats / minute. Children usually > 180 beats / minute.
  - Atrial Flutter / Fibrillation

#### Vagal Maneuvers:

Breath holding. Blowing a glove into a balloon. Have child blow out "birthday candles" or through an obstructed straw. Infants: May put a bag of ice water over the upper half of the face careful not to occlude the airway.

- Separating the child from the caregiver may worsen the child's clinical condition.
- Monitor for respiratory depression and hypotension associated if Diazepam, Lorazepam, or Midazolam is used.
- Continuous pulse oximetry is required for all SVT Patients if available.
